## Survey on Distance Magic Graphs

## Sylwia Cichacz-Przenioslo Department of Mathematics and Statistics University of Minnesota Duluth

ABSTRACT: Let $\mathrm{G}=(\mathrm{V}, \mathrm{E})$ be a graph of order n . A distance magic labeling of G is a bijection $\mathrm{I}: \mathrm{V} \rightarrow\{1,2, \ldots, \mathrm{n}\}$ for which there exists a positive integer $\mu$ such that $\sum_{x \in N(v)} l(x)=\mu$ for all $\mathrm{v} \in \mathrm{V}$, where $\mathrm{N}(\mathrm{v})$ is the open neighborhood of $v$.

Moreover, we also consider a $\Gamma$-distance magic labeling of a graph $\mathrm{G}(\mathrm{V}, \mathrm{E})$ with $|\mathrm{V}|=\mathrm{n}$ is an injection f from V to an Abelian group $\Gamma$ of order n such that the weight $\sum_{x \in N(v)} f(x)$ of every vertex $\$ \mathrm{x}$ \in $\mathrm{V} \$$ is equal to the same element $\mu \in \Gamma$. A graph $G$ is called a group distance magic graph if there exists a $\Gamma$-distance magic labeling for every Abelian group Гof order |V (G)|.

The recent results in the topics will be presented in the talk.
